Abstract

Large language models (LLMs) have shown impressive capabilities on numerous natural language processing tasks. However, LLMs still struggle with numerical question answering for financial documents that include tabular and textual data. Recent works have showed the effectiveness of critic agents (i.e., self-correction) for this task given oracle labels. Building upon this framework, this paper examines the effectiveness of the traditional critic agent when oracle labels are not available, and show, through experiments, that this critic agent's performance deteriorates in this scenario. With this in mind, we present an improved critic agent, along with the calculator agent which outperforms the previous state-of-the-art approach (program-of-thought) and is safer. Furthermore, we investigate how our agents interact with each other, and how this interaction affects their performance.

1 Introduction

Tabular and textual data are ubiquitous in many financial documents. In this paper, we focus on the numerical reasoning ability of large language models (LLMs) on financial data that includes tabular and textual data – this is a challenging task since LLMs are known to struggle on numerical reasoning for tabular data (Cao et al., 2023). More generally, LLMs have a low numerical understanding and processsing ability (Yang et al., 2024; Chen and Lin, 2024). Therefore, there is a need to improve the numerical reasoning ability of LLM approaches for tabular and textual data. Recently, Fatemi and Hu (2024) presented a multi-agent framework which used LLMs for numerical reasoning (given tabular and textual data) – at the core of their approach is the use of the critic agent for criticism. Their approach was shown to significantly outperform the chain-of-thought (CoT) approach for various sizes of llama3 models, providing us

with a cost-effective alternative to larger LLMs. While the initial results look promising, we noticed that their results seem to disagree with another recent work (Huang et al., 2024), which argued that intrinsic self-correction, which has prompts that are similar to those of the critic agent, does not improve performance – their experiments are comprehensive but did not include tabular and textual reasoning. Furthermore, it is not obvious whether the results from textual data generalizes to tabular and textual data since the positional relation of information in tables is different from text (Sui et al., 2024). We address this gap by critically examining the effectiveness of the critic agent and show that it does not outperform the CoT approach. With this in mind, we introduce an improved critic agent and a calculator agent which helps to boost the performance of LLMs.

Problem setup. Given table(s), text, and a numerical question, the goal is to provide an LLM approach (without any fine tuning) that is able to answer the numerical question with high accuracy.

2 Related Work

We first provide a summary on approaches that have been studied for tabular data alone, and then provide a summary on approaches that have been studied for both tabular and textual data.

Tabular data. (Sui et al., 2024) studied the reasoning capabilities of LLMs on tabular data and empirically showed that LLMs have the basic structural understanding capabilities but are far from perfect. The potential usefulness of LLMs for tabular data motivated other works to use LLMs as part of their approach for tabular reasoning. Two major veins of successful approaches are either to harness external tools like Python and SQL (Liu et al., 2023; Zhang et al., 2024a; Abhyankar et al., 2024), or to decompose the tables before answer-

ing the question (Wang et al., 2024; Ji et al., 2024). We refer the interested reader to this survey (Zhang et al., 2024b).

Tabular and textual data. Compared to tabular data, this area is relatively less explored. TAT-LLM (Zhu et al., 2024) fine-tuned a smaller LLM (llama 2) for the purpose of question answering from tabular and textual data. While promising, this approach faces challenges related to the high computational costs and memory requirements associated with fine-tuning LLMs. Next, we look at approaches that require no extra training or fine-tuning of LLMs.

(1) Program-of-Thought (PoT): (Chen et al., 2023; Phogat et al., 2023) This approach involves prompting the LLM directly for an executable Python code. The code is then run to give the final answer. **(2) Critic:** (Fatemi and Hu, 2024) A critic agent is introduced to refine the previous Chain-of-Thought (CoT) answer (Wei et al., 2022) from the LLM. They showed that using *oracle labels*, which are labels that indicate the correctness of the CoT answer, to guide the critic agent (i.e., only using it when the CoT answer is wrong), their approach is able to outperform CoT. **(3) Domain Specific Language (DSL):** (Phogat et al., 2023) Additional LLM prompts are used extract the calculation(s) from the first CoT answer of the LLM, and then present the calculations as a DSL program. The program is then run to produce the final answer.

The previous state-of-the-art approach for financial document question answering is PoT. However, the PoT approach is not purely intrinsic unlike the critic agent (i.e., it relies on external tools). While PoT is one viable solution to resolve the low numerical processing ability of LLMs, it might be dangerous to the company since it would require the execution of a generated program by the LLM (and having employees verify the generated program leads to latency in the company's workflow) – e.g., the code `import os; os.rmdir()` is dangerous. Therefore, there is a need for a safer method to improve the LLMs' numerical processing ability.

Main contributions. In this paper, we build on the multi-agent framework of Fatemi and Hu (2024) to study the effectiveness of the critic agent for numerical reasoning from tabular and textual data, and also to introduce the calculator agent. Our main contributions are as follows:

- We show, through our experiments, that the critic agent is not able to outperform the CoT approach when oracle labels are not available. Our result agrees with the hypothesis of Huang et al. (2024) and generalizes it to the realm of tabular and textual reasoning.

- We adapt the ideas of Li et al. (2024) to provide an improved critic agent that outperforms the previous critic-agent approach when oracle labels are not available.

- We introduce a calculator agent and show that in most cases, it outperforms the previous state-of-the-art approach (i.e., PoT) for question answering from financial documents. We also argue that it is a safer approach compared to PoT.

3 Methodology

In this section, we extend the multi-agent framework of Fatemi and Hu (2024), which includes only the analyst and critic agent, to include the improved critic agent and the calculator agent – a potentially useful agent for numerical reasoning. We describe each agent in detail and explain their interactions.

3.1 Analyst Agent

The role of the analyst agent is the following: (i) To provide CoT answer or Python code to solve the given question, (ii) Acts as an intermediary between the user and the other agents. Specifically, it processes outputs returned from other agents (critic, improved critic, and calculator) before returning the final answer to the user – visual illustration is provided in Appendix A (see Figures 2, 3, and 4).

3.2 Critic Agent and Improved Critic Agent

The critic agent provides critique on an answer provided for a given question. The critic agent, together with an analyst agent, operates as follows: (1) One LLM prompt is needed to ask the critic agent to critique the CoT answer provided. (2) The critique, together with the previous CoT answer, is then sent back to the analyst agent via another LLM prompt. (3) The analyst agent processes the input and returns the final answer to the user.

We use the critic-agent prompts provided by Fatemi and Hu (2024, Figure 5). Note that the steps above are similar to the 3-step prompting strategy for self-correction introduced by Huang et al. (2024) if all the steps use the same LLM. We show later in our Section 4 that this critic agent

does not outperform the CoT approach. With this in mind, we introduce an improved critic agent inspired by Li et al. (2024) which hypothesized that for question answering from textual data (but not tabular and textual data together), the LLM has the ability to gauge its own confidence – this ability was capitalized by Li et al. (2024) to show that LLM does indeed have the intrinsic ability to self-correct. The improved critic agent, together with the analyst agent, operates as follows: (1) One LLM prompt is needed to ask the critic agent to review the CoT answer provided and decide whether to maintain or update its answer. (2) If the critic agent decides to maintain its answer, then we will output that answer as the final answer. (3) If the critic agent decides to update its answer, then we will send both answers to the analyst agent and ask it to check both answers and the question again, before deciding on the final answer and producing it as an output.

3.3 Calculator Agent

The calculator agent takes in a CoT answer and returns the correct answer to all the calculations present in the CoT answer. The calculator agent, together with an analyst agent, operates as follows: (1) One LLM prompt is needed to ask the calculator agent to extract out all the equations in the input (i.e., the previous CoT answer). We do this by few-shot learning, i.e., we give the LLM a few examples of the desired outcome. (2) Python is then used by the calculator agent to evaluate the extracted equations correctly. Our extracted equations only contain numbers, and the symbols '+', '-', '*', '/', '(', and ')'. (3) The correct calculations are then sent back in another LLM prompt, together with the previous CoT answer, to the analyst agent to get the final answer.

This is similar to the DSL approach of Phogat et al. (2023), but unlike their approach, we directly use Python to evaluate the extracted calculations without producing a DSL program – our extracted calculations are syntactically simpler, relying only on numbers and a few symbols. Furthermore, Phogat et al. (2023) used a zero-shot approach to extract the calculations, whereas we use a few-shot approach. Phogat et al. (2023) showed that their DSL approach does not outperform PoT, whereas our calculator agent outperforms PoT in most cases (shown later in Section 5).

Regarding step 2, while we have used Python to evaluate the extracted calculations, we could

always swap it out for some calculator tool that only performs calculations and nothing else – this prevents the risk of dangerous code being executed.

3.4 Interaction between all Agents

The 3 agents stated previously will interact with each other in this manner: (1) The user sends the context (instructions, table, and text) and question over to the analyst agent to receive a CoT answer. (2) The answer is then sent to the critic (or improved critic) agent, and the critic (or improved critic) agent and analyst agent interacts to produce a refined answer – see Section 3.2 for specific steps of the interaction process. (3) The refined answer is then sent to the calculator agent, and the calculator agent and analyst agent interacts to produce a more precise answer – see Section 3.3 for specific steps of the interaction process.

4 Experiment Details

We use a weak LLM (llama3-70B), and a strong LLM (GPT4-turbo), with temperature set to 0 so that we can achieve consistent results. We use 2 popular financial tabular and textual datasets: TATQA (Zhu et al., 2021) and FinQA (Chen et al., 2021). We use *accuracy* is our evaluation metric. Additonal experiment details are provided in Appendix B.

5 Main Results

We have 2 baseline methods: (i) using the analyst agent to produce a CoT answer, and (ii) using the analyst agent to produce an executable Python code which can be executed to give us the final answer (i.e., PoT). For both datasets, we experimented with the following approaches: **(1) 'CoT', 'PoT'.** This involves either asking the analyst agent to output the CoT answer ('CoT') or Python code ('PoT') (see Section 3.1 for details). The prompts used can be found in Appendices A.1 and A.2. **(2) 'CoT + critic', 'CoT + i-critic'.** For 'CoT + critic', this involves using the analyst agent and the critic agent to get the final answer (see Section 3.2 for details). For 'CoT + critic', this involves using the analyst agent and the improved critic agent to get the final answer (see Section 3.2 for details). The prompts used for 'CoT + critic' can be found in Appendix A.3, and the prompts used for 'CoT + i-critic' can be found in Appendix A.4. **(3) 'CoT + cal'.** This involves using the analyst agent and the calculator agent to get the final answer (see Section 3.3 for

Approach	TATQA		FinQA		Combined	
	llama3	GPT4t	llama3	GPT4t	llama3	GPT4t
CoT	72.8%	84.4%	63.8%	74.0%	68.3%	79.2%
PoT	81.2%	92.1%	70.2%	71.6%	75.7%	81.9%
CoT+critic	71.3%	84.3%	64.1%	72.4%	67.7%	78.4%
CoT+i-critic	72.8%	85.8%	65.4%	72.7%	69.1%	79.3%
CoT+cal	83.4%	90.2%	72.0%	75.0%	77.7%	82.6%
CoT+critic+cal	79.7%	84.0%	67.6%	71.3%	73.7%	77.7%
CoT+i-critic+cal	81.3%	91.1%	70.2%	74.3%	75.8%	82.7%

Table 1: Accuracy of different approaches for TATQA and FinQA. The best result for each column is highlighted in blue and the second best is highlighted in green. The combined accuracy is obtained by taking the average over the two datasets – the best result for both LLMs involve the calculator agent.

details). The prompts used can be found in Appendix A.5. **(4) 'CoT + critic + cal'.** This involves using the analyst agent, the critic agent, and the calculator agent to get the final answer (see Section 3.4 for details). The prompts used can be found in Appendix A.6.

Before analyzing our results, we state the previous result of Fatemi and Hu (2024): They showed that using llama3-70B, CoT + critic performed 5.19% better than CoT for TATQA, and CoT + critic performed 3.83% better than CoT for FinQA. Our results for TATQA and FinQA are stated in Table 1, where llama3-70B and GPT4-turbo are shorten to llama3 and GPT4t, respectively. For TATQA, we have the following observations:

- For llama3-70B, CoT + cal is the best performer. Interestingly, CoT + critic performs worse than CoT implying that the critic agent is not useful – intuitively this can be viewed as the agent overthinking and we provide an example of this in Appendix A.3 where the critic agent makes a suggestion to change the previously correct answer from CoT.

- For GPT4-turbo, PoT is the best perform. As expected, CoT + critic performs worse than CoT while CoT + i-critic performs better than both CoT +critic and CoT.

For FinQA, we have the following observations:

- For llama3-70B, CoT + cal is again the best performer. Here, CoT + critic performs slightly better than CoT implying some usefulness of the critic agent. Despite the minor usefulness of the critic agent, CoT + critic + cal does not outperform CoT + cal.

- For GPT4-turbo, CoT + cal performs the best, and CoT + i-crtic outperforms CoT + critic.

Interestingly, CoT outperforms most of the other approaches except CoT + cal and CoT + i-critic + cal.

On average (see 'Combined' column in Table 1), CoT + cal performs the best when using llama3-70B and CoT + i-critic + cal performs the best when using GPT4-turbo. This suggests that the calculator agent is very useful for numerical tabular and textual reasoning, while the critic agent is not particularly useful. Furthermore, on average, CoT + cal outperforms PoT, which is the previous state-of-the-art approach for financial document question answering.

Remark. Despite using the same LLM model (llama3-70B) and datasets as Fatemi and Hu (2024), our experiment results differ significantly. This is because when comparing CoT + critic with CoT, Fatemi and Hu (2024) only ran CoT + critic on the questions that CoT got wrong (this is stated in the last paragraph of Section 4.1 in their paper) – their approach has access to oracle labels, which helps in deciding whether to use the critic agent. This is different from the way we evaluate the different approaches, where we run every single approach on the entire dataset. Further analysis of the critic agents is provided in Appendix C, and comparison of performance on integer vs. float answers are provided in Appendix D.

6 Conclusion

We provide empirical validation that the traditional critic agent does not outperform CoT when oracle labels are not available. With improvement in mind, we present an improved critic agent and a calculator agent, and show empirically that they can improve the LLM's ability in financial question answering safely.

7 Limitations

In this work, we considered two large language models llama3-70B and GPT4-turbo – a weaker LLM and a stronger LLM. It is important for us to choose the same model (i.e., llama3-70B) that was used in the previous work (Fatemi and Hu, 2024) which showed the superiority of the critic agent. We acknowledge that we did not exhaustively evaluate a large selection of large language models, but believe that our choices should be sufficient.

Regarding the choice of dataset, we acknowledge that both our datasets comes from the financial domain, which is the scope of this paper. While the domain scope of our dataset might be slightly narrow, we believe that our conclusions should apply to other types of dataset since our key focus was on the ability of our approaches to answer numerical questions with regards to tabular and textual data; our agents do not leverage on any aspects of the financial domain (e.g., we did not use a financial expert agent, or exploit any financial knowledge in our framework).

A More Details on Agents

A visualization of all the agents are provided in Figures 1, 2, 3, and 4.

Figure 1: Visualization of CoT and coder approach via the analyst agent. Flow: User feeds the table, text, and question to the analyst agent which processes the input (using CoT or PoT) and returns the final answer.

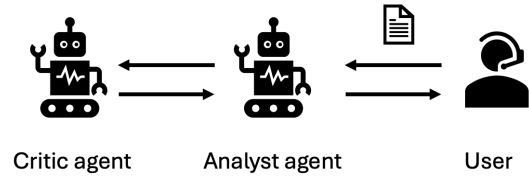

Figure 2: Visualization of the critic and analyst agents. Flow: User feeds the table, text, and question to the analyst agent which processes the input, and produces a CoT answer that is passed to the critic agent. The critic agent produces a critique and passes it to the analyst agent, which processes the CoT answer and the critique before returning the final answer.

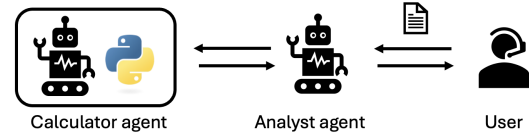

Figure 3: Visualization of the calculator and analyst agents. Flow: User feeds the table, text, and question to the analyst agent which processes the input, and produces a CoT answer that is passed to the calculator agent. The calculator agent produces an answer and passes it to the analyst agent, which processes the CoT answer and the calculator agent's answer before returning the final answer.

A.1 Prompt for CoT

We provide the prompt used for the CoT approach.

```
Read the following texts and table carefully. Present your answer in
↪  the following JSON format:
{
    "steps": ["show the calculation steps"],
    "answer": "final numerical answer"
}
### Text
{text}
### Table
{table}

### Question
{question}
```
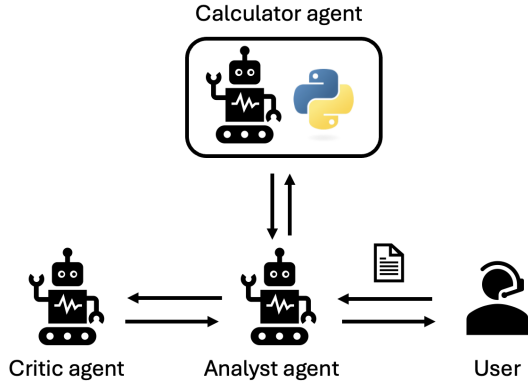

Figure 4: Visualization of the critic, calculator, and analyst agents. Flow: User feeds the table, text, and question to the analyst agent which processes the input, and produces a CoT answer that is passed to the critic agent. The critic agent and analyst agent interacts (exactly like in Figure 2) to produce a refined answer. The refined answer is then sent to the calculator agent, and the calculator agent and analyst agent interacts (exactly like in Figure 3) to produce a more precise answer – which will be the final answer sent to the user.

A.2 Prompt for PoT

We provide the prompt used for the coder approach.

```
Do not answer the question. Instead, your task is to write some python
↪   code that answers the question when it is executed.
Present your python code in the following format:
``
"python code here"
``

### Text
{text}

{table}

### Question
{question}
```

A.3 Example of Critic Agent Overthinking

We present one example of the critic agent overthinking from the TATQA dataset. The user's prompt are coloured in red, and the LLM's output are coloured in black. In the following example, the correct answer is $8590 which tallies with the CoT answer. However, the critic agent found fault with the CoT answer and presented a new answer which is wrong.

```
Read the following texts and table carefully. Present your answer in
↪   the following JSON format:
{
    "steps": ["show the calculation steps"],
    "answer": "final numerical answer"
}
### Text
Other assets consist of the following (in thousands):
(1) In the first quarter of fiscal 2019, we invested 3.0 million Euro
↪   ($3.4 million) in 3D-Micromac AG, a private company in Germany. The
↪   investment is included in other assets and is being carried on a
↪   cost basis and will be adjusted for impairment if we determine that
↪   indicators of impairment exist at any point in time.
### Table
|  | Fiscal year-end |  |
|  | 2019 | 2018 |
| Assets related to deferred compensation arrangements (see Note 13) |
↪   $35,842 | $37,370 |
```

```
| Deferred tax assets (see Note 16) | 87,011 | 64,858 |
| Other assets(1) | 18,111 | 9,521 |
| Total other assets | $140,964 | $111,749 |

### Question
What was the change in Other assets in 2019 from 2018?
```

```
Here is the answer in the requested JSON format:

{
    "steps": [
        "Get the value of Other assets in 2019 from the table: $18,111",
        "Get the value of Other assets in 2018 from the table: $9,521",
        "Calculate the change in Other assets: $18,111 - $9,521 =
↪       $8,590"
    ],
    "answer": "$8,590"
}
```

```
Review a given context, question, and the response given by an agent.
↪   Then, you must reflect on the analysis and provide a detailed
↪   critique. Do not round numerical answers.
### Context and Question
### Text
Other assets consist of the following (in thousands):
(1) In the first quarter of fiscal 2019, we invested 3.0 million Euro
↪   ($3.4 million) in 3D-Micromac AG, a private company in Germany. The
↪   investment is included in other assets and is being carried on a
↪   cost basis and will be adjusted for impairment if we determine that
↪   indicators of impairment exist at any point in time.
### Table
|  | Fiscal year-end |  |
|  | 2019 | 2018 |
| Assets related to deferred compensation arrangements (see Note 13) |
↪   $35,842 | $37,370 |
| Deferred tax assets (see Note 16) | 87,011 | 64,858 |
| Other assets(1) | 18,111 | 9,521 |
| Total other assets | $140,964 | $111,749 |

### Question
What was the change in Other assets in 2019 from 2018?
### Response
Here is the answer in the requested JSON format:

{
    "steps": [
        "Get the value of Other assets in 2019 from the table: $18,111",
        "Get the value of Other assets in 2018 from the table: $9,521",
        "Calculate the change in Other assets: $18,111 - $9,521 =
↪       $8,590"
    ],
    "answer": "$8,590"
}
```

```
Here's my critique of the response:

**Accuracy:** The response is partially accurate. The calculation of
↪   the change in Other assets is correct, but the values used are
↪   incorrect.

**Error Analysis:** The mistake lies in the values used for Other
↪   assets in 2019 and 2018. The correct values should be $18,111 (not
↪   just the value of "Other assets(1)" which is $3.4 million) and
↪   $9,521, respectively. The correct calculation should be:

$140,964 (Total other assets in 2019) - $111,749 (Total other assets in
↪   2018) = $29,215

**Improvement Suggestions:**

1. Read the table carefully: The agent should have noticed that the
↪   "Other assets" column is a total of three components, and not just
↪   the value of "Other assets(1)".
2. Understand the question: The question asks for the change in "Other
↪   assets", not just the change in "Other assets(1)".
3. Perform the correct calculation: The agent should have calculated
↪   the change in Total other assets, not just the change in one
↪   component of Other assets.

**Revised Response:**

{
    "steps": [
        "Get the value of Total other assets in 2019 from the table:
↪       $140,964",
        "Get the value of Total other assets in 2018 from the table:
↪       $111,749",
        "Calculate the change in Total other assets: $140,964 -
↪       $111,749 = $29,215"
    ],
    "answer": "$29,215"
}
```

```
Given the following critique for a response given by an agent, output
↪   your answer to the question below in the following JSON format and
↪   nothing else:
```

```
{
    "steps": ["show the calculation steps and equations (if there are
    ↪ any)"],
    "answer": "final numerical answer"
}
### Context and Question
### Text
Other assets consist of the following (in thousands):
(1) In the first quarter of fiscal 2019, we invested 3.0 million Euro
↪ ($3.4 million) in 3D-Micromac AG, a private company in Germany. The
↪ investment is included in other assets and is being carried on a
↪ cost basis and will be adjusted for impairment if we determine that
↪ indicators of impairment exist at any point in time.
### Table
|   | Fiscal year-end |   |
|   | 2019 | 2018 |
| Assets related to deferred compensation arrangements (see Note 13) |
↪ $35,842 | $37,370 |
| Deferred tax assets (see Note 16) | 87,011 | 64,858 |
| Other assets(1) | 18,111 | 9,521 |
| Total other assets | $140,964 | $111,749 |

### Question
What was the change in Other assets in 2019 from 2018?
### Response
Here is the answer in the requested JSON format:

{
    "steps": [
        "Get the value of Other assets in 2019 from the table: $18,111",
        "Get the value of Other assets in 2018 from the table: $9,521",
        "Calculate the change in Other assets: $18,111 - $9,521 =
        ↪ $8,590"
    ],
    "answer": "$8,590"
}
### Critique
Here's my critique of the response:

**Accuracy:** The response is partially accurate. The calculation of
↪ the change in Other assets is correct, but the values used are
↪ incorrect.

**Error Analysis:** The mistake lies in the values used for Other
↪ assets in 2019 and 2018. The correct values should be $18,111 (not
↪ just the value of "Other assets(1)" which is $3.4 million) and
↪ $9,521, respectively. The correct calculation should be:

$140,964 (Total other assets in 2019) - $111,749 (Total other assets in
↪ 2018) = $29,215

**Improvement Suggestions:**

1. Read the table carefully: The agent should have noticed that the
↪ "Other assets" column is a total of three components, and not just
↪ the value of "Other assets(1)".
2. Understand the question: The question asks for the change in "Other
↪ assets", not just the change in "Other assets(1)".
3. Perform the correct calculation: The agent should have calculated
↪ the change in Total other assets, not just the change in one
↪ component of Other assets.

**Revised Response:**

{
    "steps": [
        "Get the value of Total other assets in 2019 from the table:
        ↪ $140,964",
        "Get the value of Total other assets in 2018 from the table:
        ↪ $111,749",
        "Calculate the change in Total other assets: $140,964 -
        ↪ $111,749 = $29,215"
    ],
    "answer": "$29,215"
}
```

```
{
    "steps": [
        "Get the value of Total other assets in 2019 from the table:
        ↪ $140,964",
        "Get the value of Total other assets in 2018 from the table:
        ↪ $111,749",
        "Calculate the change in Total other assets: $140,964 -
        ↪ $111,749 = $29,215"
    ],
    "answer": "$29,215"
}
```

A.4 Prompt for Improved Critic Agent

We provide the prompts used for the CoT + i-critic approach. The user's prompts are colored in red, and the LLM's outputs are colored in black.

```
Read the following texts and table carefully. Present your answer in
↪ the following JSON format:
{
    "steps": ["show the calculation steps"],
    "answer": "final numerical answer"
}
### Text
{text}
### Table
{table}
### Question
{question}
```

```
{CoT output}
```

```
Review your previous answer to the question below using the texts and
↪ table. If you are very confident about your answer, maintain your
↪ answer. Otherwise, update your answer. Present your final answer in
↪ the following JSON format:
{
    "steps": ["show the calculation steps"],
    "answer": "final numerical answer"
}
### Text
{text}
### Table
{table}
### Question
{question}
### Previous answer
{CoT output}
```

```
{i-critic agent output}
```

At this stage, if the i-critic agent is confident of its output and wants to maintain the previous CoT answer, we will output that answer as the final answer. However, if the critic agent decides to update its answer, then we will send both answers to the analyst agent and ask it to check both answers and the question again, before deciding on the final answer and producing it as an output – the corresponding prompts are presented below.

```
You gave two different answers in previous responses. Check the
↪ question and your answers again, and give the best answer. Present
↪ your final answer in the following JSON format:
{{
    "steps": ["show the calculation steps"],
    "answer": "final numerical answer"
}}
### First previous answer
{CoT output}
### Second previous answer
{i-critic agent output}
```

```
{analyst agent output}
```

A.5 Success Example of CoT + Cal

We provide an example of the prompts that are used. The user's prompt are coloured in red, and the LLM's output are coloured in black. The following example shows how the calculator agent can help correct the CoT answer.

```
Read the following texts and table carefully. Present your answer in
↪ the following JSON format:
{
    "steps": ["show the calculation steps"],
    "answer": "final numerical answer"
}
### Text
```

```
Refranchisings and franchisee development — The following table
↪   summarizes the number of restaurants sold to franchisees, the
↪   number of restaurants developed by franchisees, and gains
↪   recognized in each fiscal year (dollars in thousands):
(1) Amounts in 2019, 2018, and 2017 include additional proceeds of $1.3
↪   million, $1.4 million, and $0.2 million related to the extension of
↪   the underlying franchise and lease agreements from the sale of
↪   restaurants in prior years.
(2)  Charges are for operating restaurant leases with lease commitments
↪   in excess of our sublease rental income.
(3) Amounts in 2018 primarily represent $9.2 million of costs related
↪   to franchise remodel incentives, $8.7 million reduction of gains
↪   related to the modification of certain 2017 refranchising
↪   transactions, $2.3 million of maintenance and repair expenses and
↪   $3.7 million of other miscellaneous non-capital charges. Amounts in
↪   2017 represent impairment of $4.6 million and equipment write-offs
↪   of $1.4 million related to restaurants closed in connection with
↪   the sale of the related markets, maintenance and repair charges,
↪   and other miscellaneous non-capital charges.
Franchise acquisitions — In 2019 and 2018 we did not acquire any
↪   franchise restaurants. In 2017 we acquired 50 franchise
↪   restaurants. Of the 50 restaurants acquired, we took over 31
↪   restaurants as a result of an agreement with an underperforming
↪   franchisee who was in violation of franchise and lease agreements
↪   with the Company. Under this agreement, the franchisee voluntarily
↪   agreed to turn over the restaurants. The acquisition of the
↪   additional 19 restaurants in 2017 was the result of a legal action
↪   filed in September 2013 against a franchisee, from which legal
↪   action we obtained a judgment in January 2017 granting us
↪   possession of the restaurants. Of the 50 restaurants acquired in
↪   2017, we closed eight and sold 42 to franchisees.
### Table
|  | 2019 | 2018 | 2017 |
| Restaurants sold to franchisees | — | 135 | 178 |
| New restaurants opened by franchisees | 19 | 11 | 18 |
| Proceeds from the sale of company-operated restaurants: |  |  |  |
| Cash (1) | $1,280 | $26,486 | $99,591 |
| Notes receivable | — | 70,461 | — |
|  | $1,280 | $96,947 | $99,591 |
|  |  |  |  |
| Net assets sold (primarily property and equipment) | $— | $(21,329) |
↪   $(30,597) |
| Lease commitment charges (2) | — | — | (11,737) |
| Goodwill related to the sale of company-operated restaurants | (2) |
↪   (4,663) | (10,062) |
| Other (3) | 88 | (24,791) | (9,161) |
| Gains on the sale of company-operated restaurants | $1,366 | $46,164
↪   | $38,034 |
### Question
What is the percentage constitution of cash in the total gains on the
↪   sale of company-operated restaurants in 2019?
```

```
{
    "steps": [
        "Get the total gains on the sale of company-operated
↪       restaurants in 2019 from the table: $1,366",
        "Get the cash proceeds from the sale of company-operated
↪       restaurants in 2019 from the table: $1,280",
        "Calculate the percentage of cash in the total gains: ($1,280 /
↪       $1,366) * 100%"
    ],
    "answer": "93.2%"
}
```

```
Given the following list of steps, filter out all the equations and
↪   list them out in JSON format below.
Use only numbers without commas (decimal points are allowed), and the
↪   symbols "+", "-", "*", "/", "(", ")".
The answer must only include the JSON format and nothing else.
### Example
### List of steps
['The number of schemes is not provided in the context. Therefore, we
↪   cannot calculate the average defined contribution schemes.']
### Answer
{
"answer": []
}
### Example
### List of steps
['First, we need to find the difference between EBITDA and underlying
↪   EBITDA for each year.', 'EBITDA (FY19) = 79,046, underlying EBITDA
↪   (FY19) = 85,123, so the difference (FY19) = 85,123 - 79,046 = 6,077
↪   thousand.', 'EBITDA (FY18) = 63,954, underlying EBITDA (FY18) =
↪   62,575, so the difference (FY18) = 63,954 - 62,575 = 1,379
↪   thousand.', 'Next, we need to find the average of these
↪   differences:', 'Average difference = (6,077 + 1,379) / 2 = 7,456 /
↪   2 = 3,728 thousand dollars.']
### Answer
{
"answer": ["85123-79046=6077", "63954-62575=1379",
↪   "(6077+1379)/2=7456/2=3728"]
}
### Example
### List of steps
['Percentage change = (183,191 - 7,081) / 7,081 * 100 = 2,493.634%',
↪   'Alternatively, we can do ($176,110 ÷ $7,081) × 100']'
### Answer
{
```

```
"answer": ["(183191-7081)/7081*100=2493.634", "(176110/7081)*100"]
}
### List of steps
{
    "steps": [
        "Get the total gains on the sale of company-operated
↪       restaurants in 2019 from the table: $1,366",
        "Get the cash proceeds from the sale of company-operated
↪       restaurants in 2019 from the table: $1,280",
        "Calculate the percentage of cash in the total gains: ($1,280 /
↪       $1,366) * 100%"
    ],
    "answer": "93.2%"
}
### Answer
```

```
{
"answer": ["(1280/1366)*100"]
}
```

```
Given the following list of correct calculations for a response given
↪   by an agent, improve on the response and output it in the following
↪   JSON format:
{
    "steps": ["show the calculation steps and equations (if there are
↪       any)"],
    "answer": "final numerical answer"
}
### Response
{
    "steps": [
        "Get the total gains on the sale of company-operated
↪       restaurants in 2019 from the table: $1,366",
        "Get the cash proceeds from the sale of company-operated
↪       restaurants in 2019 from the table: $1,280",
        "Calculate the percentage of cash in the total gains: ($1,280 /
↪       $1,366) * 100%"
    ],
    "answer": "93.2%"
}
{
"correct calculations": "['(1280/1366)*100=93.70424597364568']"
}
```

```
Here is the improved response in the requested JSON format:

``
{
  "steps": [
    "To find the percentage, divide the numerator (1280) by the
↪     denominator (1366) and multiply by 100.",
    "The calculation is: (1280 ÷ 1366) × 100"
  ],
  "answer": "93.70%"
}
``
```

A.6 Prompt for CoT + Critic + Cal

We provide the prompts used for the CoT + critic + cal approach. The user's prompts are colored in red, and the LLM's output are colored in black.

```
Read the following texts and table carefully. Present your answer in
↪   the following JSON format.
Keep numbers in your answer of the same scale as those in the table.
For example, do not change 1,000 thousands to 1,000,000 in your answer.
{
    "steps": ["show the calculation steps and equations (if there are
↪       any)"],
    "answer": "final numerical answer"
}

{analyst agent output}
```

B Additional Experiment Details

We point out that the different agents (introduced in Section 3) are built by prompting one LLM to carry out different tasks – the same LLM is used for the entire approach. In other words, although we are making multiple calls to the same LLM, we apply the design abstraction of using multiple agents.

Dataset preparation. We apply our approach to the following popular financial tabular and textual datasets:

- **TATQA** (Zhu et al., 2021): We use the dev dataset since it has answers to all the questions, along with the type of question (i.e., numerical or non-numerical). We filter out the numerical questions from the dataset, which is a total of 717 questions.

- **FinQA** (Chen et al., 2021): All questions are numerical. We use the dev set since it contains all the answers to the questions – a total of 883 questions.

Questions where any of our approaches exceed the context length are omitted.

Evaluation Metric. We denote the true answer as a and the estimated answer as $\hat{a}$. For the evaluation metric, we use accuracy defined as

$$100\% \times \frac{1}{n}\sum_{i=1}^{n} \mathbb{1}\{a = \hat{a}\},$$

where n is the total number of questions answered, and $\mathbb{1}\{\cdot\}$ is the indicator function where $\mathbb{1}\{a = \hat{a}\} = 1$ if $a = \hat{a}$ and 0 otherwise. We consider the estimated answer $\hat{a}$ to be equivalent to the true answer a if $\hat{a}$ and a are exactly the same, or if $\hat{a}$ can be rounded to obtain a. For example, if $a = 0.98$, then $\hat{a} = 0.98$ and $\hat{a} = 0.979$ are both accepted.

C Analysis of Critic Agents

Analysis of the critic agent. We investigate the tendency of the critic agent to switch its answer. The results are displayed in Figure 5. For both datasets and LLMs, the proportion of answers that were changed from correct to wrong, and the proportion of answers that were changed from wrong to correct are roughly the same. This implies that the critic agent does not have a clear ability to improve the answer.

	llama3	GPT4t
Rate(corr|conf)	75.9%	87.0%
Rate(¬corr|conf)	24.1%	13.0%
Rate(corr|¬conf)	41.9%	72.2%
Rate(¬corr|¬conf)	58.1%	27.8%
Rate(conf)	90.9%	91.8%

Table 2: Confidence rates for TATQA where Rate(corr|conf) means rate of correct answer given that the LLM is confident.

	llama3	GPT4t
Rate(corr|conf)	69.8%	75.0%
Rate(¬corr|conf)	30.2%	25.0%
Rate(corr|¬conf)	37.9%	54.5%
Rate(¬corr|¬conf)	62.1%	45.5%
Rate(conf)	77.5%	88.9%

Table 3: Confidence rates for FinQA.

Analysis of the improved critic agent. We investigate how the improved critic agent performs given its confidence level. Our statistics for TATQA are presented in Table 2, and our statistics for FinQA are presented in Table 3. For TATQA, the rate of confident is around the same for both llama3-70B and GPT4-turbo. For FinQA, GPT4-turbo tends to be more confident in its answers compared to llama3-70B. The rate of confidence for both models in FinQA is lower compared to TATQA implying that FinQA is the more challenging dataset. For both datasets, the rate of correct given confident is greater than the rate of incorrect given confident, implying LLM has some accurate sense of its confidence. As expected, GPT4-turbo, the stronger model, has a higher rate of getting correct when it is confident.

D Integer vs. Float Answers

Here we look at how our approaches differ in performance for questions with integer answer versus questions with float answer. The results are shown in Tables 4 and 5. The key observations are as follows:

- For TATQA, with llama3-70B, CoT + cal performs the best for integer answers and PoT performs the best for float answers. With GPT4-turbo, CoT + i-critic performs the best for integer answers and PoT performs the best for float answers.

- For FinQA, with llama3-70B, CoT + cal per-

Figure 5: Analysis of the changes in the correctness of answers by the critic agent. Pie charts on the left are for TATQA and pie charts on the right are for FinQA.

forms the best for integer answers and float answers. With GPT4-turbo, CoT + i-critic + cal performs the best for integer answers and CoT + cal performs the best for float answers.

The results justify the importance of the improved critic agent for questions with integer answers.

Approach	llama3		GPT4t	
	int	float	int	float
CoT	86.9%	61.2%	91.5%	78.6%
PoT	82.7%	79.9%	92.5%	91.7%
CoT + critic	85.3%	59.9%	91.2%	78.6%
CoT + i-critic	86.3%	61.8%	94.2%	78.9%
CoT + cal	87.9%	79.7%	93.2%	87.8%
CoT + critic + cal	83.0%	77.0%	86.4%	81.9%
CoT + i-critic + cal	85.9%	77.5%	93.2%	89.4%

Table 4: Accuracy of the approaches for the integer-answer questions and the float-answer questions of TATQA. The best result for each column is highlighted in blue and the second best is highlighted in green.

Approach	llama3		GPT4t	
	int	float	int	float
CoT	75.1%	55.9%	79.8%	69.7%
PoT	75.9%	66.2%	75.1%	68.9%
CoT + critic	72.4%	58.3%	78.5%	67.9%
CoT + i-critic	75.5%	58.3%	78.8%	68.2%
CoT + cal	78.2%	67.6%	79.5%	71.7%
CoT + critic + cal	75.1%	62.4%	74.1%	69.2%
CoT + i-critic + cal	76.3%	65.9%	80.1%	69.9%

Table 5: Accuracy of the approaches for the integer-answer questions and the float-answer questions of FinQA. The best result for each column is highlighted in blue and the second best is highlighted in green.
